AP 17-2 10. 11. 2026

This is long distance - intercellular communication, coordination & control is critical for homeostasis → & is fundamental function of the endocrine system.

17 Overview of the endocrine system →

obj → Distinguish the type of intracellu communication, their importance, mechanisms & effects

Identify the major organs & tissues the endocrine system & their loc in the body

(ommunication is a process in which a sender transmits signals to one or more receivers to control & coordinate ~~ac~~ actions

"relative" long distance comm. in Human body

↳ ~~to~~ two major organ systems participate ~~in relat~~ the nervous system & the endocrine system

↳ these two systems maintain homeostasis in the body.

Neural & Endocrine Signaling →

→ The N. system uses two types of intracellular comm - electrical (action potential) chemical neurotransmitters → such serotonin or ~~nore~~ norepinephrine.
