AP 17-4 10.11.2026

hormones for flight/fight epinephrine & norepinephrine
↳ within seconds

* may take 48 hours for target cells to respond to certain reproductive hormones.

{ Endocrine signaling is typically less specific than neural signaling

The same hormone oxtocin promotes uterine contractions in people during labor promotes breastfeeding / mammels emotional/sexual response in humans attachment

* The endocrine system is usually slower acting ⇒ taking care of the internal env of the body, maintaining homeostasis ⇒ & controlling reproduction.

	Endocrine System	Nervous system
signaling mechanism(s)	Chemical	Chemical/electrical
primary chemical signal	hormones	Neurotransmitters
	long or short	Always short

	Endocrine System	Nervous Sys
Response time	Fast or slow	Always fast
Environment targeted	Internal	Internal & External
