AP 17-6 10.11.2026

The hypothalamus
thymus,
heart,
Kidneys,
stomach,
small intestine,
liver,
skin,
ovaries / testes
are all other organs that contain cells with endocrine function.

Adipose tissue as well? → produce hormones → bones?

★ Do not confuse the <u>exocrine system</u>

exocrine system release hormones through glands with ducts. → such as sebaceous & sweat glands of the skin

The Pancrease also has an exocrine function →
most of its cells secrete pancreatic juice through the pancreatic & accessory ducts to the <u>lumen</u> of the small intestine

Other Types of Chemical Signaling

In Endocrine signaling → hormones secreted into the extracellular fluid diffuse into the blood or lymph
