Amine Hormones →

derived from amino acids

Typically, the original structure of the amino acid is modified such that a $-COOH$ or carboxyl group is removed, whereas the $-NH_3^+$ or amine, group remains-

Amine Hormones - are synthesized from amino acids → tryptophan or tyrosine

melatonin derived from tryptophan secreted by the pineal gland.

Tyrosine derivatives include the metabolism → regulating thyroid hormones & catecholamines

epinephrine, norepinephrine, dopamine

Epinephrine & norepinephrine are secreted by the adrenal medulla → flight/fight

Dopamine secreted by the hypoThalamus inhibits the release of certain anterior pituitary hormones.
