Peptide & Protein Hormones

~~Amine~~ Amine are derived from single amino acid

Peptide & Protein are ~~derived~~ consist of multiple amino acids that link to form an amino acid chain.

Peptide Hormones consists of short chains of amino acids, Protein are longer polypeptides-

Both are synthesized like all other body proteins →

Ex of Peptide Hormones → include antidiuretic
ADH → fluid balance (pituitary)

atrial- natriuretic peptide → produced by the heart & helps to decrease blood pressure

Protein hormones - include growth H.
FSH

Steriod Hormones → Primary hormones derived from lipids are steroids →

→ derived from lipid cholesterol
