Thyroid Hormones – cross the cell membrane by a specific carrie – mediated mechanism that is energy ~~te~~ dependendent

→ The loc of steroid & Thyroid H binding differs slightly

A steroid H. may bind with the cytosol or within the nucleus.

→ In either case → this binding generates a hormone – receptor complex that moves toward the chromatin in the cell nucleaus & binds to a particular segment of the cell's DNA

while → Thyroid hormones bind to recpt → already bound to DNA

Both of these methods of binding – hormone – receptor complex with DNA triggers transcription of a target gene to mRNA → moving the cytosol & directs protein synthesis. by Ribosomes.

## Pathways Involving Cell membrane Hormone Receptors

Water Soluble – Hydrophillic → DO NOT diffuse at cell surface.
