Pathways Involving Cell Membrane Hormone Receptors

Hydrophillic → water soluble hormones → do NOT diffuse through the lipid Bilayer. →

→ Therefore must pass on their message to a receptor located @ the surface

Except for Thyroid hormones → are lipid soluble

* All amino-acid derived hormones - (which are peptides)

→ hormones in the blood that are water soluble

↳ * All amino-acid derived hormones → again → peptides bind to cell membrane receptors that are located ; at least in part, on the extracellular surface of the cell membrane

↳ They do NOT directly affect the transcription of target genes → instead init a signaling cascade that is carried out by a molecule called a

2nd messenger (The hormone in this case is the 1st messenger)

i.e. → the hormone that bind to the receptor

cAMP → cyclic adenosine monophosphate ← Remember

Within the ~~&~~ cAMP (2nd msgr) system a water soluble (Hydrophillic) binds to its receptor in the cell membrane this

↳ This receptor is associated with an
