AP- 17-27 10.12.2026

The intracellular component is called the G-protein

(2) The binding of the G protein with the hormone activates the G-protein component

↳ The activated G protein in turn activates an enzyme → [adenylyl cyclase] ← Remember this

this is in step (3), which converts ATP to cAMP (4)

at step (5) the 2nd messanger cAMP activates a type of enzyme called protein kinase

protein kinase is present in the cytosol
