Platelets + certain proteins → block blood loss

Maintenance of Homeostasis

Recall that body temp is regulated via a classic negative-feedback loop

blood close to skin for heat exchange
away from skin to preserve heat

pH is also maintained → the chemical balance of the body → also regulates H_2O content of somatic cells.

Composition of Blood

hematocrit → measures the % of RBCs

RBCs are heavier -> centrifuge

- Pale thin layer is WBCs leukocytes -> platelets, cell frags called thrombocytes
- → Buffy coat → because of its color

usually less than 1% of blood sample

above the buffy coat is the (pale - straw colored fluid)
