PCV → packed cell volume

RBCs

The volume of ~~RCBs~~ after centrifugation → 2> ~~norm~~ ~~norm~~ normal blood 45% of a sample is RBCs

The ~~hemato~~ hematocrit of any 1 sample can ~~a~~ vary significantly → about ~~30~~ 36-45% of a sample varies by gender & other factors.

Male → hematocrit ranges from 42-52 with mean of 47

Female → 37 to 47 → mean of 41

other formed Elements → WBC » platelets is extremely small insignificant

So the mean plasma percentage is the percent of blood that is NOT erythrocytes / RBCs

(> which is for females → 59 (100-41)

males → 53 (100-47)

Anemia → Depressed hematocrit

Polycythemia → Elevated hematocrit
