Plasma Proteins

about 7% of the volume of plasma

nearly all of which is NOT water // is made of proteins

3 major groups of Plasma

Albumin is the most abundant of the plasma proteins

~~★ transports~~ Albumin molecules serve as binding proteins → transport vehicles for fatty acids & steroid hormones ← ~~hydrophilic~~ hydrophobic

★ Remember that lipids are NOT → water soluble
hydrophobic → but they are transporte in the watery plasma

Albumin is also the most significant contrib to the osmotic pressure of blood

↳ this means its presense holds water inside the blood vessels & draws water from tissues across blood vessel walls & into the bloodstream

which holds water // maintains blood volume & pressure
