AP-18.1, 67 10.12.2026

Albumin normally accounts for approx 54% of total plasma protein content, in clinical levels of 3.5 - 5.0 g/dL blood

Next most common type of Plasma Protein, 2nd to Albumin is ⇒ Globulins

A heterogeneous group further divided → 3 main subgroups

globulins

transport iron, lipids & fat soluble vitamins A, D, E, K also contributes to osmotic pressure

gamma globulins ⇒ are proteins involved mainly in immunity aka Antibodies aka immunoglobulins

These are produced by white blood cells leukocytes (plasma cells)

make about 38% of total plasma protein →
