Production of the Formed Elements

- Trace the generation of the formed elements of blood / from bone marrow stem cells

- Discuss the role of hemopoietic growth ~~hormones~~ factors in promoting

The ~~prod~~ production of the formed elements

★ lifespan of formed element is brief

most WBC, RBCs & platelets normally live a few hours to a few weeks only one WBC can live for years.

Body creates / forms new blood cells / platelets -> quickly & continuously. When donating a unit of blood (approx 475 ml 1 pint) →

the body will replace the plasma within 24 hours → takes 4 to 6 weeks to replace the blood cells

This restricts the frequency with which doners can contrib their blood cells

hemopoiesis → The process in which replacement occurs

Greek Root →

haima = 'blood'

poiesis → production
