abnormal ~~of~~ for RBC to leave vessels.

~~Although~~

Shape & Structures of RBC

Reticulocyte → immature RBC, when reticulocyte leaves the red bone marrow it extrudes its nucleus & most of its other organelles

Reticulocytes should compromise approx 1-2 % of the erythrocyte count & provide a rough estimate of the rate ~~RPC~~ RBC production →

These ~~Remen~~ remants, primarly of network (reticulum) of Ribosomes → are quickly shed → for mature circulating & RBC have few internal structures/components.

↳ lack mitochondria → RBC rely on Anerobic Respiration they do not utilize the O_2 they transport.

No endoplasmic Reticulum

However, RBC do contain structural proteins that help the blood cells maintain their unique structure → & enable them to change shape to ~~see~~ squeeze through capillaries

↳ of which includes → protein spectrin

A cytoskeleton protein element
