AP 18.3-26 10.13.2026

Disorders of Erythrocytes

the number of hemoglobins molecules can have a major impact on a person's health

Anemia → 3.5 millions Americans → when RBCs or hemoglobin deficient

more than 400 types of Anemia

→ Broken down into 3 major groups

(1) caused by blood lose (like J. Caesar) or faulty decreased RBC → destructive of RBC →

diagnosis → **The kinetic approach** focus on evaluating the production, destruction & removal of RBCs

Morphological Approach examines the RPCs themselves particular emphasis to their size

→ **MCV** mean corpuscle volume measures the size of the RBC

Normal-sized cells are ~~refered~~ referred to as normocytic

smaller than - normal cells → microcytic | while macrocytic for larger cells

---

The effects of anemia are widespread. reduced numbers of RBCs or hemoglobins → result in lower O_2 → being delivered to tissue.

Since O_2 is required for tisrue - anemia

fatique, lethargy, risk for infection

headaches → & irratability
