AP-18.4-3 #3 10.13.20
26

~~Esonip~~ ~~Es~~ Eosinophil - will typically have ~~to~~ two to 3 lobes
stained reddish-orange

~~esan~~ eosinophils → include antihistamine
histamines produced by basophils & mast cells
Some eosinophil gran. contain molecules toxic to parasitic worms → enter through the integument
~~cooked or~~

Eosinophils → ~~are also~~ can phagocyte antibodies → that target & form antigen-antibody complex

Eosinophil high count → allergies, parasitic worms autommune disease
low count = drug ~~/toxicity~~ toxicity / stress

Basophils → ~~ba~~ least common, typically compromising
less than 1 percent of the total leukocyte count → slightly smaller than neutrophils & ~~es~~ eosinophils

The granules ~~in~~ of basophils 8-10 μm in diameter
stain best with alkaline stains
contain large granules- that pick up a dark stain & are common that they make it difficult to see the two-lobed nucleus-

Basophils → intensify the inflammatory response
they share this trait with mast cells.
In the past → Mast cells were considered to be basophils → that left the circulation
the two cells are from 2 diff types of lineages-
