AP- 18.4 - 3 4 10. 13. 20 26

The granules of basophils →
↳ release histamines → contributes to inflammation
↳ & heparin which ~~opposes~~ opposes blood ~~clotti~~ clotting →
High counts → of Basophils - are associated with allergies, parasitic infection, & hypothyroidism low counts are associated with pregnancy, stress, & hyperthyroidism

Agranular leukocytes → contain smaller - less visible granules in their cytoplasm than do granular leukocytes →
The nucleus - is simple in shape sometimes with an indentation → No distinct lobes

2 major types of ~~Stain~~ agranulocytes
: lymphocytes & monocytes

Lymphocytes → are only formed element of blood that arises from lymphoid stem cells. Although they form initially in the bone marrow, much of their subsequent development - & reproduction occurs in the lymphatic tissues

Lymphocytes are the 2nd most common WBC → 20 - 30 % of all leukocytes → essential for immune response
