Monocytes-
↓ macrophages -> have left the circulation & phagocytize debris, foreign pathogens, worn-out RBC & many other dead, worn out -> & damaged cells

Macrophages also release antimicrobial defensins & chemotactic chemicals that attract other Leukocytes to the site of an infection

Some macrophages occupy fixed locations whereas other wander through the tissue fluid.

High counts -> monocytes -> are associated with viral, fungal infections -> tuberculosis ~~& some fixed location~~ & some forms of leukemia -> ~~& chronic disease~~.

Lifecycle of Leukocytes

most leuks have a relatively ~~short~~ short life span measured in hours / days

Productions of ALL leuks -> begin in bone marrow under the influence of CSFs & interleukins -> 2ndry production & maturation of lymphocytes -> occurs in specific regions of lymph tissue known as

Germinal Centers
