AP. 18.4. 39 — 10. 13. 20 25

Lymphoma → is a form of cancer in which masses of T / B lymphocytes collect in lymph nodes

Some progress slowly → & respond to treatment ~~fast~~ well

Platelets → The other Formed Element

Thrombocytes - platelets are NOT cells → a frag of cytoplasm of a cell called MegaKaryocyte that is surrounded by plasma membrane → they descend from myeloid ~~cell~~ stem cells →

typically large → 50 – 100 μm in diameter contain large/enlarged lobed nucleus →

thrombopoietin → a glycoprotein secreted in by the Kidneys & liver stimulates - the prof proliferation of megaKaryoblasts megaKaryoblasts mature into megaKaryocyte

→ of which remain in bone marrow tissue → ultimately form platelet - precursor extensions that extend through the walls of bone marrow capillaries → ~~to~~ release into ~~the fragments are platelets → precursor~~ the circulation

thousands of cytoplasmic fragments - each enclosed by a cell membrane
