Intristic Pathway →

aka Contact Activation pathway ✡

is longer & more complex

In this case factors are intristic (present with in) the bloodstream

The pathway can be prompted by damage to the issues, resulting from internal factors such arterial disease → it is most often init... when factor XII → aka (Hageman factor)

↳ Hageman factor when a blood sample is put into a glass test tube

within the body factor XII → is typically activated when it encounters - negatively charged molecules → such as inorganic polymers

↳ phosphate produced earlier in the series of intristic pathway reactions

Factor ~~IV~~ XII sets of a series of reactions that in turns activates factor XI (antihemolytic factor C or plasma thromboplastin) antecedent then the increase the rate of these activation reactions finally factor VIII (antihemolytic factor A) from the platelets & endothelial cells combines →
