The ~~int~~ extrinsic Pathway → which normally is triggered by trauma

• The intrinsic pathway → begins in the bloodstream & is triggered by internal damage to the wall vessel.

↓

Both → these merge into a 3rd pathway

reffered to as a common pathway ← Remember this

↑

All 3 pathways are dependent ~~on~~ upon the 12 known clotting factors → including ~~2+~~ Ca^{2+} & vitamin K → Clotting factors → are secreted ~~by~~ primarily by the liver & platelets

The liver requires -> be fat soluble -> K^+ + ~~Vitamin K~~ (along with biotin & folate)

is somewhat ≠ unusual among vitamins → in that it is not only consumed in the diet but is also synthesized by bacteria residing ~~be~~ in the large intestine.

The Ca^{2+} ion is considered factor IV is derived from the diet & from the breakdown of bone ← Recent evidence indicates -> that the activation of various clotting factors occurs on specific receptor sites. on the surface of platelets.
