AP 18.4 - 40 10. 13. 20
26

18.5 These enclosed frags are platelets.

Each ~~megaky~~ megakaryocyte releases 2000 - 3000 platelets during its lifespan

Following Platelet release, megakaryocyte -> remnants -> a little more than a cell nucleus -> are consumed by macrophages

Platelets -> are relatively small 2-4 μm diameter, but numerous -> typically 150,000 - 160,000 per μl of blood

upon circulation -> 1/3 migrate to spleen. for later release - blood vessel rupture

They then become activated to perform their primary function, to limit blood loss

remain 10 days -> phagocyteed by macrophages

Disorders of Platelets -> Thrombocytosis

is a condition in which there are too many platelets -> blood clots

while Thrombocytopenia -> blood does not clot

18.5 **Hemostasis**

Platelets are key players in hemostasis

body seals a ruptured blood vessel & prevents loss of blood

simple wounds

(3) steps in process ->

vascular spasm,
