& the inner visceral pericardium or ' φ epicardium ⇒ which is fused to the heart & is part of the heart wall.

The Pericardial cavity filled with lubricating ~~serious~~ serous fluid ⇒ lies between the epicardium 2,

The visceral serous membrane of the heart i.e the epicardium is NOT microscopic rather macroscopic ⇒ consisting of simple squamos epithelium called mesothelium

★ mesothelium ⇒ simple squamos epithelial cells ★

↳ reinforced with loose, irregular or areolar connective tissue that attaches to pericardium which secrets the lubricating fluid that fills the pericardial cavity / reduces frictin

cardiac tamponade or pericardial tamponade ⇒ blood accumulates prevents full relaxation
