Surface features of the heart Inside the pericardium the surface of the heart is ~~vis~~ visible, including 4 chambers

Superficial leaf structure

near the superior surface of the heart

auricle → ear like → thin wall structures that can fill with blood & empty into atria or upper chambers of the heart

Also → prominent → a series of fat-filled grooves, each of which is known as sul-cus ↳ at along the superior surfaces of the heart.

Major - coronary blood vessels are located in the ~~sul~~ sulci

Coronary Sulcus → is located between the atria & ~~vent~~ ventricles

between the left & right ventricles - are two additional ↳ sulci NOT as deep as the coronary sulcus

This is the anterior intra interventricular sulcus is visible on the anterior surface of the heart → whereas the posterior interventricular sulcus is visible on the posterior ~~side~~ surface of the heart

Layers → The wall of the heart is composed of 3 layers of unequal thickness From superficial to deep, these are the ① epicardium

② myocardium

③ endocardium
