AP 19.1 (9)

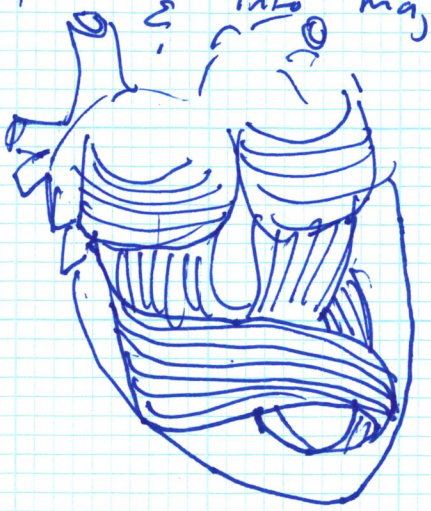

Ch. 15.
2 & 26

Remember → That the outermost layer of the wall of the heart is also the innermost layer of the pericardium, the epicardium or the visceral pericardium

Myocardium → middle & most thickest

made largely of cardiac muscle cells - built on a framwork of Collagenous fibers plus the blood vessels that supply the myocardium → & the nerve fibers that help regulate the heart.

✡ Understand it is the contraction of the ~~myo~~ myocardium that pumps the blood through the heart & into major arteries

The ventricles of both right & left sides pump the same amount of blood per contraction →

The muscle of the left ventricle is more thicker

This is in order to pump
