AP 19.1 (11) 10. 15. 2026

The Septa → are physical extensions of the ~~heart~~ → myocardium lined with endocardium located between the two atria

↓ is the a interatrial Septum

The interatrial ~~Heart~~ Septum → bears an oval shaped - depression → known as the fossa ovalis

The foramen oval allowed blood in the fetal heart to pass directly from the right → atrium to the left atrium allowing some blood to bypass → the pulmonary circuit within seconds after birth

↳ a the septum primum that previously acted as a valve closes the foramen & ovale & establishes the typical cardiac circulation pattern.

~~Inter~~ Interventricular Septum → Between the two ventricles

2nd septum

Unlike the ~~intr~~ interventricular is normally intact after its formation during fetal development

It is substantially thicker than the interatrial septum, since the ventricles generate far greater pressure when they contract.

Atrioventricular Septum

This is the septum between the atria & ventricles
