AP 19.1 (12) 10.15.20
26

The antrioventricular septum → is marked by the ~~presense~~ presence of 4 openings that allow blood to move from the atria into the ventricules & ~~the~~ from the ventricules into the pulmonary trunk that & aorta.

Between each of there openings → i.e 4 openings → is a valve which specializes in flow one way → The valves between the atria & ventricles are known generically as the atrioventricular valves

The Semilunary Valves → These are the valves that at the openings & that lead to the pulmonary trunk & ~~aorta~~ aorta

bicuspid - tricuspid valves

Cardiac Skeleton → Since these openings & valves structurally weaken the antrioventricular septum, the remaining tissue is heavely reinforced with dense connective tissue - The cardiac skeleton also provides

Right Atrium The right Atrium → serves as the chamber for blood returning to the heart from the systemic circulation →

- Right Atrium receives deOxy O_2 from two major systemic veins
  - the superior - & inferior Vena Cava
