The flaps are connected by chordae tendineae
↳ to the papillary muscles → which controls the opening & closing of the valves

Pulmonary valve (emerging from the right ventricle) at the base of the pulmonary trunk is the Pulmonary semilunar valve or the pulmonary aka the pulmonic valve or the right semilunar valve

↳ the pulmonary valve / aka pulmonic valve compromised of 3 small flaps of endothelium reinforced with connective tissue. When the ventricle relaxes, the pressure differential causes blood to flow back into the ventrical from the pulmonary trunk // This flow of blood fills the pocket-like flaps of the pulmory valve, causing the valve to close & producing an audible sound.
