AP (19.1 - 2ϕ Blood Flow from the left 1ϕ. 15. 2ϕ
Ventricle into the Great Vessels 26
When two atrioventricular values are closed
but two semi lunar values ar
open → the mitral value prevents backflow of blood.

When contract ventricles rises & blood flows pressure within the area of lowest pressure toward the

→ This low pressure causes the cusps of tricuspid/Right & mitral valve to close

* The aortic pulmonary semilunar valves lack the chordae & tendineae & papilary muscles associated with atrioventricular valves

The aortic pulmonary semilunar valves → consist of pocket-like folds of endocardium reinforced with additional connective tissue.

when ventricles relax & change in pressure forces the blood toward the ventricles →
