AP(19.1)(26) (19.2) 10.16.24
26

The anterior cardiac Veins

parallel the small cardiac arteries & drain the anterior surface of the right ventricle. Unlike these other cardiac veins, it bypasses the coronary & drains directly into the right atrium

Disorders of the Heart: Coronary Artery

→ CA → is the leading cause of death worldwide
plaque → a fatty material including cholesterol, connective tissue → WBC + smooth muscle cells
ischemia → (caused by hypoxia)
begins in children → smoking alcohol etc

Angioplasty is a procedure → in which the occlusion is mechanically widened by a balloon; a stent may be added.

(19.2) → Cardiac Muscle & Electrical Activity

Cardiac Muscle = skeletal muscle + smooth muscle it has - some unique properties → of its own.
The exceptional properties → is its ability an electrical potential at fixed rate that spreads rapidly from cell to trigger the contractile mechanism.
→ autorhythmicity → Both skeletal & smooth muscle alone cannot do this!
→ modulated by the endocrine & nervous systems

two types → of Cardiac Muscle(s)
① Myocardial Contractile Cells 99%
② Myocardial Conducting cells 1%
* Except for Purkinje cells → generally smaller than the contractile cells
