(AP)(19.2)(28) Ch. 15. 2p 26

Cardiac muscle cells branch freely. A junction between two adj cells is marked by critical structure called an (intercalculated) disc → contraction of the helps support the sync muscle. The sarcolemmas from adj cells bind together at the intercalated ~~cells~~ discs. They consists of ~~dem~~ desmosomes, specialized linking proteoglycans & large numbers of gap junctions that allow passage of ions ← sync contractions

Intercellular Connective tissue → also helps to bind the cells together

The importance of strongly binding these cells together is necessitated by the forces exerted by contraction

Cardiac Muscle → have myofibils - composed of myofilaments arranged in sarcomers - T-tubules transmit the impulse from the sarcolemma to the interior of the cell

☆ An intercalculated disc - connects cardiac muscle cells & consists of desmosomes →
