(19.2) SA node conduction threshold first

The SA node, without endocrine / nervous or control, would emit a heart impulse approx 8Ø - 1ØØ ~~BPM~~ Bpm.

each component of the conductive system of heart is capable of generating its own impulse. → the rate progressively slows

Purkinje fibers

* Without the SA node, the AV node ~~will~~ would generate a heart rate of 4Ø - 6Ø BPM

The atrioventricular bundle would fire rate at 3Ø - 4Ø impulses per minute.

The bundle branches would have an inherent 2Ø-3Ø impulses - per minute.

Purkinje fibers → would fire at 15-2Ø min 28 BPM for a cyclest

Below 5Ø BPM → bradycardia

Electrocardiogram

Tracing Electrical signal uses 3, 5, 12 leads

The greater the number of leads an ~~ekg~~ ECG just electrode →

12 uses 1Ø electrode →

Holter Monitor → monitors → patient for 24 hours
