There are 5 prominant ECG
: The P wave
the QRS complex
& T wave

P wave is small - represents the depolarization of the atria
The atria begin to contracting approx 25 ms after the start of the P wave

Large QRS complex → represents the deplorization of the ventricles, which requires a much stronger electrical signal because of the large size of the ventricular cardiac muscle.

The ventricle begins to contract as the QRS reaches the peak of the R wave.

Lastly the T-wave represents the repolarization of the ventricles. The repolarization of the atria occurs during the QRS complex, which makes it on an ECG

Segments are defined as the regions between two waves →

* Intervals include one segment + one or more waves

e.g → PR segment begins at the end of the P wave and at the begining of the QRS complex

The PR interval is more clinically relevant as it measures the duration from the ~~beginin~~ ~~of trial~~ of atrial depolarization beginning the (P wave) to the initiation of the QRS complex
